

Appendix. SL4 transpose web pairings for 4 x 4 tableaux

One entry is shown per self-duality class; the smaller representative index is retained.
Convention: the displayed value is the ordered computation $\langle W, W^T \rangle$ for the retained W ;
it is not averaged, replaced by its absolute value, or substituted by the reverse computation.
The Double Trident label records that the Double Trident relation was used in the computation.

Appendix. SL4 transpose web pairings for 4 x 4 tableaux

One entry is shown per self-duality class; the smaller representative index is retained.
Convention: the displayed value is the ordered computation $\langle W, W^T \rangle$ for the retained W ;
it is not averaged, replaced by its absolute value, or substituted by the reverse computation.
The Double Trident label records that the Double Trident relation was used in the computation.

Appendix. SL4 transpose web pairings for 4 x 4 tableaux

One entry is shown per self-duality class; the smaller representative index is retained.
Convention: the displayed value is the ordered computation $\langle W, W^T \rangle$ for the retained W ;
it is not averaged, replaced by its absolute value, or substituted by the reverse computation.
The Double Trident label records that the Double Trident relation was used in the computation.

Appendix. SL4 transpose web pairings for 4 x 4 tableaux

One entry is shown per self-duality class; the smaller representative index is retained.
Convention: the displayed value is the ordered computation $\langle W, W^T \rangle$ for the retained W ;
it is not averaged, replaced by its absolute value, or substituted by the reverse computation.
The Double Trident label records that the Double Trident relation was used in the computation.

Appendix. SL4 transpose web pairings for 4 x 4 tableaux

One entry is shown per self-duality class; the smaller representative index is retained.
Convention: the displayed value is the ordered computation $\langle W, W^T \rangle$ for the retained W ;
it is not averaged, replaced by its absolute value, or substituted by the reverse computation.
The Double Trident label records that the Double Trident relation was used in the computation.

Appendix. SL4 transpose web pairings for 4 x 4 tableaux

One entry is shown per self-duality class; the smaller representative index is retained.
Convention: the displayed value is the ordered computation $\langle W, W^T \rangle$ for the retained W ;
it is not averaged, replaced by its absolute value, or substituted by the reverse computation.
The Double Trident label records that the Double Trident relation was used in the computation.

Appendix. SL4 transpose web pairings for 4 x 4 tableaux

One entry is shown per self-duality class; the smaller representative index is retained.
Convention: the displayed value is the ordered computation $\langle W, W^T \rangle$ for the retained W ;
it is not averaged, replaced by its absolute value, or substituted by the reverse computation.
The Double Trident label records that the Double Trident relation was used in the computation.

Appendix. SL4 transpose web pairings for 4 x 4 tableaux

One entry is shown per self-duality class; the smaller representative index is retained.
Convention: the displayed value is the ordered computation $\langle W, W^T \rangle$ for the retained W ;
it is not averaged, replaced by its absolute value, or substituted by the reverse computation.
The Double Trident label records that the Double Trident relation was used in the computation.
